

# **Allegheny County Data Warehouse**

February 2024

The Allegheny County Data Warehouse brings together and integrates client and service data from a wide variety of sources both internal and external to the County. It was created by consolidating publicly funded human services data (e.g., behavioral health, child welfare, intellectual disability, homelessness and aging) and, over time, expanded to include data from other sources (see **Appendix** for a list of sources). The Data Warehouse was made possible with support from the <u>Human Service Integration Fund</u>, a flexible funding pool created by a coalition of local foundations for the purpose of supporting integration and innovation within DHS.

The Data Warehouse was designed primarily to improve services to clients, but also to improve the ability of workers to perform their jobs and to support management decision-making; it is also intended to be available as a community resource, making data and information publicly available whenever possible.

# HISTORY

The Allegheny County Data Warehouse was originally conceived as a way to develop a common client management technology system across the disparate programs that were consolidated into a single Department of Human Services (DHS) in 1997. However, a group of Carnegie Mellon University students studied the problem and concluded that a fully integrated system was not possible. Instead, they — along with the Chamber of Commerce and a number of private sector stakeholders – presented a different approach: a Data Warehouse to link client-level data across systems without requiring that those individual systems share a common technology.

In 2000, the local community foundation released a Request for Proposals, and, with \$2.8 million in pooled foundation funding, signed a contract on behalf of Allegheny County with Deloitte Consulting to build the initial Data Warehouse. The Data Warehouse was operational in 2001 and able to integrate client data across DHS's program areas; in 2003, the first external source of data (from the Pennsylvania Department of Human Services) was integrated. A description of the technology involved in integrating data is provided in the **Appendix**.

Development of the Data Warehouse was possible because of a unique confluence of factors. Leadership, meaning (1) the political will to invest resources in the technology infrastructure and analysts to do the work and (2) willingness to put the findings into practice, was a key factor, as was a local political climate that was open to the changes required to support integration of human services in Allegheny County. Another key to the success of the initiative was the time and effort spent developing trust between DHS and its data partners. And finally, creation of the Human Services Integration Fund represented an unprecedented display of support for the newly integrated department and its integration and innovation efforts.

The cost of maintaining the Data Warehouse, including 29 analysts, seven data leads and technical support, is about \$6.5 million annually. This represents less than 1% of DHS's total budget, which is considered a worthwhile investment when taking into account all the ways in which it supports quality service delivery and more.

### **BUILDING PARTNERSHIPS TO INTEGRATE DATA**

Sharing data within DHS and with other County departments (e.g., Housing Authority, Jail, Probation Office, Health Department, Medical Examiner) was relatively simple, as each is an organizational component of Allegheny County government and operates subject to oversight by the County Executive. Therefore, no formal agreements were determined to be necessary to allow for data sharing. This is not to say that data-sharing among these entities occurs without governance. DHS implemented data governance practices that allow for interoperability and cross-agency sharing. For more information, see <u>Sharing of Client Information for Service</u> <u>Coordination and Quality Improvement Activities</u>.

Sharing data with non-Allegheny County government entities required more extensive data-sharing agreements. Establishing a Memorandum of Understanding (MOU) that outlines duties, responsibilities, compliance issues and safeguards requires careful negotiation, legal expertise and patience. The partnership with the Pittsburgh Public School district is a good example of what goes into such an agreement.

## Public School/DHS Data-Sharing Agreement

After years of negotiation, a significant milestone in the use of the Data Warehouse occurred in 2009, with the creation of a data-sharing agreement with the Pittsburgh Public School (PPS) district. Since then, similar agreements have been established with 20 local school districts and education entities including charter schools and the Allegheny Intermediate Unit,<sup>1</sup> allowing for service and system activities designed to improve educational and well-being outcomes for school-aged children involved in human services. DHS and PPS attorneys focused on issues of confidentiality inherent in sharing student and client data, including the issue of how to legally obtain consent to use student records. After thinking through various options, the attorneys found a solution in a 2008 FERPA amendment that permitted the release of personally identifiable student data without consent to organizations interested in conducting research to improve student achievement as long as these organizations had a signed MOU that outlined confidentiality parameters and data use protocols. By tying the use of the data to actionable research, these attorneys found an innovative way to draft a legal agreement that met all of the requirements of FERPA and HIPAA. The agreement provides the framework for integrating student data, including confidentiality provisions, the responsibilities of each party, the type of information that can be shared and the purposes for which it can be shared. A key provision authorizes the use of the data for conducting "action research," which means that 1) DHS will use the data to prepare analytical reports related to students in the school district who receive services from DHS and 2) DHS and the school district will create, implement and evaluate strategies developed from these statistical analyses.

<sup>&</sup>lt;sup>1</sup> Although MOUs have been established with 20 districts, as of April 2018 only six have developed the technical capacity to share their data.

More information about these data-sharing agreements and the resulting analyses and strategies can be found <u>here</u>.

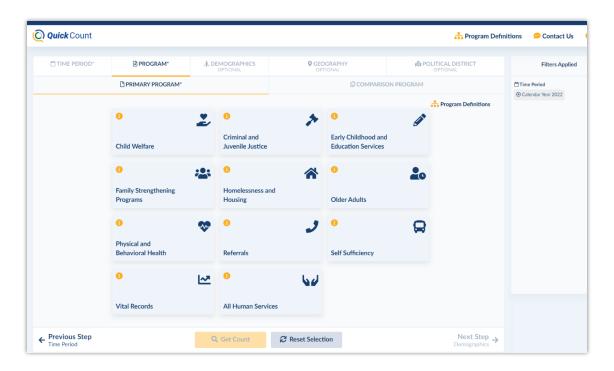

## **USING INTEGRATED DATA**

What makes the Allegheny County Data Warehouse unique? Unlike data warehouses that are developed for research purposes or "one-shot" analyses, Allegheny County's Data Warehouse was designed to support integrated client service and decision-making. Its value is evident in the ways in which it has supported the development of a variety of analytic and decision-making tools that put the power of integrated data into the hands of staff and providers. But DHS leadership didn't stop at creating tools — they also developed ways to make information and analysis widely available in the form of datasets, publications and visualizations housed on <u>Allegheny County Analytics</u>.

#### QuickCount

<u>QuickCount</u> is a publicly available resource that allows for queries about participation in a wide range of services from data integrated in the Data Warehouse. In addition to the ability to compare two programs, users can sort by time period, view participation in multiple services, and filter counts demographically and geographically. QuickCount provides data that helps community groups, providers, researchers and other stakeholders to understand the types and scope of services utilized and to use this information for service planning.

*QuickCount Search Screen* — as seen below, users select a primary program and, if desired, a comparison program. Users indicate a specific time period and may also select demographic and geographic filters from the menu at the top.

*QuickCount Search Results* — the screen below shows the number of clients active in mental health services compared to the number of parents associated with a child welfare allegation, investigation or case; it also shows the overlap between the two. Users may view these results by program as well as any of the filters selected on the search screen (sex, age, race, municipality, neighborhood, school district, zip code and governmental jurisdictions). Users are able to click on information in the trends and metrics section to view activity over time in the selected services, behavioral health diagnoses, and chronic physical conditions of the selected clients.

While <u>Allegheny Analytics</u> and <u>QuickCount</u> are publicly available, the following tools and dashboards — for privacy and confidentiality reasons — were designed for use only by staff and contracted provider agencies.

## **Client View**

*Client View* provides information about individual clients and their service involvement across all data sources in the Data Warehouse. Demographic information is also available, as well as service plans, assessments and electronic documents. Client View is available only to authorized users within DHS and contracted provider agencies. Individual clients are able to view their own service data through a resident portal called <u>AccessMyInfo</u>.

*Client View Search Screen* — Users may search for a client by name or social security number or click on advanced search to search by other criteria.

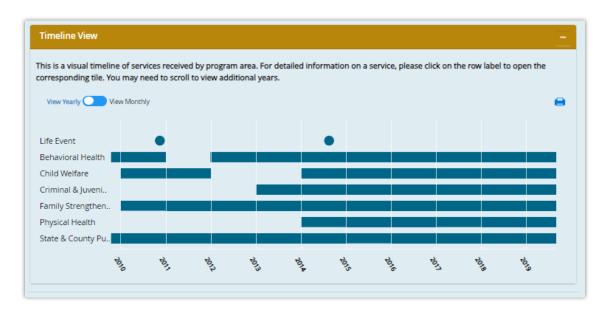

lient Search	า

# AccessMyInfo

<u>AccessMyInfo</u> is DHS's resident portal that allows users to view and access their own human services and health information and use it for self-directed case management. This tool improves users' ability to access their information easily, safely and securely. AccessMyInfo allows individuals to securely login and view their case history and service involvement across DHS Programs. They can see a history of caseworkers and providers as well as their service plans and assessments.

# **Provider Connect**

**Provider Connect** is available to DHS providers and partners to allow DHS to more easily share information from the County back to providers on all the clients they are working with. It is offered to providers by DHS in an effort to improve business operations, quality improvement efforts and strategic planning. Specific views and downloads vary by provider type, but all providers have access to the Client Profile. The help page has videos of the tool for additional information (Click here).

#### **Data-driven decision-making**

Allegheny County uses the Data Warehouse to develop models to predict adverse outcomes for individuals and to use those predictions to inform worker decision-making at the time of child welfare call screening (Allegheny Family Screening Tool), to do outreach and proactively offer supportive services to high-need new parents (Hello Baby), and to inform housing resource allocation decision-making (Allegheny Housing Assessments). The County is committed to creating and implementing these tools through community engagement and conversation, competitive procurement, monitoring, and a commitment to modification and improvement, evaluation and transparency. Information on these and future tools can be found on Allegheny County Analytics.

# **Outcomes Tool**

The *Outcomes Tool* is designed to help DHS staff monitor the outcomes of various programs or services. It allows users to upload or create a client list, to examine defined outcomes for those clients in criminal justice, education, behavioral health, homelessness and housing, and child welfare systems and to create data files for additional analysis.

The *Outcomes Tool Navigation Menu* allows a user to choose to view reports and lists that have already been created, create/upload client lists, and create new reports or data files. There are also guides, templates and data dictionaries to assist the user.

The **Outcomes Tool My Reports Screen** lists all of the user's existing reports and allows for:

Below is an example of an *Outcomes Tool Report*, showing the percentage and number of clients involved in a specific program and breakdowns by gender and race. By clicking on the buttons (  $\frac{1}{2}$   $\frac{10}{2}$  ), users can view the actual data and additional metrics or download the data into an Excel file.

The *Outcomes Tool Create List Screen* allows the user to define the parameters of a new list and to use additional custom filters to select on multiple criteria. For example, a user may select a cohort of people using mental health services during a specific time period and use custom filters to narrow that list to members of the cohort who also had an episode of homelessness and a jail booking within a designated time period.

#### Alerts

Recognizing that there are a number of key events in a family's life that may have an impact on the safety of the home environment, we designed an approach, leveraging the Data Warehouse, to alert DHS staff and providers when any one of several key events occurs. The alerts show up when a user logs into a case management or workflow management application; they may also be texted or emailed to the user. Examples of events that may trigger an alert are birth of a child, charges filed against a parent or client, and school truancy. Alerts are categorized as immediate, urgent or informational and, whenever available, links are provided to documents that contain more information about the alert.

DHS also leverages the Data Warehouse to do direct outreach to clients through text messages. These communications include timely alerts, public policy updates, client experience surveys and opportunities to participate in paid data collection activities. Clients may receive text messages automatically after qualifying service involvement or through a manual, staff-initiated action. Read more about text outreach at DHS <u>here</u>.

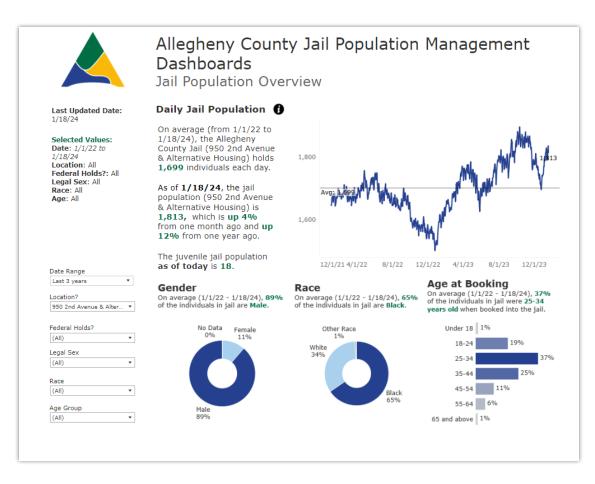

# Dashboards

Dashboards are available on an internal dashboards hub (DASH) and on Allegheny Analytics. Dashboards are designed to support internal and external planning and decision-making, and allow the viewer to view demographic, service and utilization information. Dashboards can be manipulated to specify client demographics, service/diagnosis, year and cost as well as comparisons and trends over time.

#### **Examples of dashboards:**

The <u>Allegheny County Jail Population Management dashboard</u> provides detailed information about people in the jail, why they are in jail, and their service involvement prior to jail entrance. Users are able to use filters along the lefthand side to change the date ranges and to examine specific demographic groups.

The dashboard also allows users to select specific jail booking cohorts by year and examine their program involvement in selected time frames prior to their booking. A user can examine the percentage of those booked in a given year who had substance use treatment in the 12 months prior to their booking.

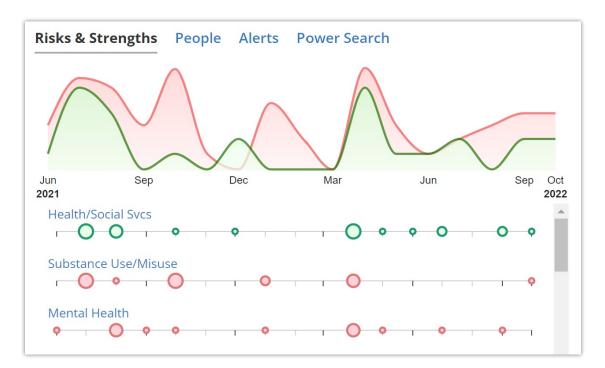

The *Older Adult Protective Services dashboard* provides integrated information about alleged victims of elder abuse. It allows the user to see rates of involvement in physical and behavioral health services, criminal justice, income supports, child welfare and homelessness services.

# **Unstructured data**

In 2022, Allegheny County began using natural language processing on unstructured administrative data and case notes to help workers find the right information at the right time, to gain insights across cases, to expedite case review and to integrate case notes across service systems using the warehouse. The tool allows workers to see trends across notes and find information more easily.

#### WHAT'S NEXT?

The County continues to integrate new data sources, develop new and better tools for people to use that data, and innovate on methods to use that data most effectively to improve services and outcomes for people using those services. It is investing in improving how the Data Warehouse matches (and 'un-matches') people, creating tools for easier integration of new sources and creating more robust integration and linkages in areas like familial relationships. The County is improving how it uses its unstructured data, expanding its point-of-service data collection and use of client experience data, creating rapid-cycle evaluations for new projects, and implementing new models to prioritize people and to better match them to services that work.

#### TO LEARN MORE ABOUT THE DATA WAREHOUSE

The Data Warehouse has been studied extensively, written about in a number of publications and recognized for its innovation in information technology. A selection of articles that appeared in national publications, as well as a podcast and a DHS-presented paper about the Data Warehouse, are listed below.

Better Government Through Data: Using the Allegheny County Data Warehouse to design more effective results for clients and the public. Institute for Excellence in Government, Harvard University, October 2020

The Medical Examiner investigates cases of homicide, suicide, overdose, accidental deaths and natural deaths that are sudden, unexpected or medically unattended.
- 27. Labor and Industry employment, earnings and unemployment insurance benefits information

Each new data source added to the Data Warehouse involves a process that requires the development of trust and a shared vision as well as coordinating details such as the form in which data will be provided. Most partners send information weekly, and it is loaded into the Data Warehouse through an Extract, Transform and Load (ETL) Platform. The ETL is set up to accept data in different formats and load them into the central data area. At DHS, a team of programmers use IBM DataStage to create each ETL, and Oracle database management software to store it. Setting up the ETL is the most complex function involved; it accounts for about 80 percent of the technological work of the Data Warehouse.

Once client data are loaded into the Data Warehouse, each client is assigned a unique identifying number. In this way, all client-specific information can be pulled together to provide a comprehensive picture of client needs. It also ensures that individuals are not counted more than once.

The Data Warehouse requires ongoing data quality management. This is accomplished by an administrator who coordinates data, a support team that loads information, and an operational team that does weekly maintenance and performs data archiving.
